

Getting better cellphone coverage with Nelspecs.

A guide to improving vehicle fitted cell reception by Technical Sales at Nelspecs Ltd.

Being able to maintain cell coverage away from the office is crucial for many businesses.

Nelspecs offers packages ranging from a bare minimum solution for extended coverage, allowing you to make calls while stopped, to advanced car kit packages which permit lawful hands-free use while driving.

One touch or voice activated dialling systems can allow important calls to be made while driving between destinations.

The key to getting a good outcome with any radio system is to start with a good signal. We use antennas which focus on the horizontal area surrounding your vehicle this improves reception and helps reduce interference.

A low loss antenna cable brings the signal into your car where a booster increases it many thousands of times over. The booster operates off your vehicles battery voltage.

The booster is designed to provide wireless connectivity across very small spaces. An internal antenna pad can be fitted to your cell phone allowing you to use it when you are stopped.

Because the law prohibits cell phones to be held while driving we do not promote wireless kits.

The preferred option is to install car booster kits with cradles for phones where calls can be taken with a minimum of touches.

A hands free cradle allows your phone to be mounted at arm's reach and answered with one touch. The cell signal is emitted from the cradle and connectivity to external speakers and other equipment can be made with plug in leads.

Top of the line car kit accessories can be added with cradles allowing practical hands-free dialling and operation.
